

Let Jack Miner Make Ice Cream on Your Window Sill

GIVE the family a special treat with the most tempting ice cream recipe that you can think of. Use the simple formula to make and delicious as it is. Mix a quart of Jell-O Ice Cream Powder (one about 100 with a quart of half milk, half cream. Place the mixture in the window sill in a freezing vessel. Stir a few times and Old Man Miner will finish the job. The cream will be in the flavors. Try a package today!

ICE CREAM POWDER

A Worthy Objective

There are few Canadians who have not heard something of the work and achievements of Jack Miner, Canada's pioneer game conservator, and Canada's first and only game warden. It is not surprising, therefore, to find that he is now being honored to thank for the opportunities they now enjoy in both countries in hunting such noble birds as the Canada goose and other species of wild fowl which might today be regarded as scarce. Jack Miner over a quarter of a century ago.

Jack Miner has become almost an international figure in this country during that period and his name and his sanctuary at Kingsville, Ontario, have spread far and wide, it is not to be wondered that his fame has been so widely known. He has been so successful in his work that he has been honored and operated so successfully for so many years that it is to be expected that future generations are to be secured an opportunity of seeing him in his own country.

The sanctuary which he established as far back as 1894 has served as a breeding ground for wild fowl and has been a source of income to him. A result has provided a breeding ground for birds for sportsmen in both Canada and the United States. In only three years this have been for years and still is a source of supply of birds for the continent, the overflow from today enables large numbers of hunters to enjoy a sport which would otherwise have been restricted to the time.

As a result of Jack Miner's system of tagging the birds which have been carefully conserved, ever since 1900, he has a great deal of data available to support the contention that his refuge is a source of supply for the entire continent.

A Fount of Inspiration

One of the greatest benefits which have been derived on both sides of the international boundary has been the fact that Jack Miner and his place have been the awakening of public consciousness to the value and importance of wild life as an asset to both Canada and the United States and of its importance as a stimulus to the conservation of the same.

The efforts of this 75-year-old pioneer conservationist have, also been the cause of work, which has been the cause of the formation of many men's organizations and other groups as well as federal and local governments on both sides of the line to "go and do likewise." As a result of his work, there is a chain of bird refuges in both Canada and the United States. The famous Jack Miner sanctuary have been established throughout the continent and in the United States. The work of Jack Miner has been developed for a similar purpose. Without these, and back of them the inspiration initiated by Jack Miner may of the best species of waterfowl which would have suffered the fate of the extinct species of the earlier days with an abundant refuge which staggered the world.

Jack Miner would never have been in Canada if it were not for Jack Miner's unselfish devotion of a life-time to a conservation program, the laws which have been placed on the statute books of legislatures and parliaments in both Canada and the United States, and the fact that the cooperation between the two countries which has afforded additional protection to migratory birds have been implemented, or if it had been, it would not have been effective.

Jack Miner, though still well and active, has already passed the allotted age of mankind, but to what extent the work that he has done will be continued and the memorial which will be erected in his honor, is not certain, in fact, unless those who are interested in preserving such valuable and beautiful birds as the Canada goose and other species of wild fowl as the Jack Miner Migratory Bird Foundation has been incorporated in Michigan as well as in Ontario by a special act of Parliament with the hope of raising a fund to which the public may contribute and which may be used for the purpose of maintaining the sanctuary which he has created.

One can only hope that many wealthy Americans who, as sportsmen and bird lovers, have derived so much benefit from Jack Miner's achievements and who are interested in the same, will give some consideration to this important project. Museum for the purpose of the Jack Miner sanctuary and the other bird refuges which have been established, and which have been the cause of the formation of many men's organizations and other groups as well as federal and local governments on both sides of the line to "go and do likewise."

It is not to be wondered that his fame has been so widely known. He has been so successful in his work that he has been honored and operated so successfully for so many years that it is to be expected that future generations are to be secured an opportunity of seeing him in his own country.

WORLD HAPPENINGS
BRIEFLY TOLD

Russia kept pace with world's speeding armaments race by floating one 800-ton battleship and laying the keel for another.

Dr. Anton Korobetz, Russian Catholic priest and popular Soviet agent, was elected president of the Yugoslav senate.

A Royal Air Force Supermarine Spitfire, shot down by German fighters, was recovered by the RCAF, covering the 200 miles in 41 minutes.

Through the Ontario Chinese Benevolent Association, the Canadian firm at Bradford, Ont., has supplied 1,600 blankets for Chinese in war areas.

The battle cruiser Repulse, in dry dock at Portsmouth, England, for repairs in preparation for the royal visit in June, is now named with the full crew.

Isabella Preston, ornamental horticulturist specialist at the central experimental farm, Ottawa, has been awarded the London Royal Horticultural Society gold medal.

Japan kept pace with world's speeding armaments race by floating one 800-ton battleship and laying the keel for another.

What Problem
Best Remedy Needed For Determining
The Worst Policies

Former John Bracken of Manitoba states that "the only way that peace can be achieved" is a fundamental, not a solution of the world's worst problems.

In addressing several hundred people at the Calgary meeting of the Canadian League of Women Voters, Mr. Bracken urged that the best brains in western Canada be determined to assist the police and then with a "united voice" with Canada-wide difficulties.

"At the Winnipeg marketing conference, held in 1935, I was given responsibility of naming a committee to study the different phases of this problem," Mr. Bracken said. He visited the police and other members of the police and then with a "united voice" with Canada-wide difficulties.

"The recovery of lost markets, another one of the worst of the world's problems, is the result of failure of the first and refusal of the second, the readjustment of agriculture and economic life to the world to meet new conditions."

"The recovery of lost markets, another one of the worst of the world's problems, is the result of failure of the first and refusal of the second, the readjustment of agriculture and economic life to the world to meet new conditions."

The Indian Method
How To Achieve It In Ice Breaks
Under You

At this time of year when people are "breaking through" the ice, deep water, an Indian gives advice on how to avoid drowning by crawling back to safety.

The Indian guide gave the advice in comment recently on the drowning of a hunter after he had broken through the ice.

Soil Drifting Under Control

Solution Of Soil And Farm Problems On The Prairies

Soil drifting has been brought under control on the Prairies and drought areas, George Spence, director of Prairie Farm Rehabilitation, told the Canadian Club at Ottawa.

"In many parts of the west soil drifting has been brought under control," he said. "It can and has been effectively stopped with the help of many volunteer men."

When the Prairie Farm Rehabilitation act was passed in 1930, it was in 1935 it was the first step toward a solution of soil and farm problems in the prairie provinces.

In 1937 the act was amended to include land utilization and land settlement and now the P.F.R.A. has three main activities—farming, soil conservation, land utilization and water conservation.

The soil utilization work is attempting to correct errors made 20 years ago in the settlement of the west. In their own day some had the credit they desired. The United States and Great Britain together, but the recent advances in tide have been a brief period of years and the rapid acceptance. The respective directors, James Harvey and Martin, preferred financially and the two later experienced much personal distress.

Speaking of the community pastures scattered through the low-lying areas, Mr. Spence said that the work was to make breeding centers in every community pasture to improve the land.

The speaker warned that "if adequate pasture is not furnished for the stock, the land will be lost." He said that the work was to make breeding centers in every community pasture to improve the land.

Cold Affected Big Ben

London Daily of Famous Clock Reduced To Thy Day

In December London's climate is probably at its worst. The cold, the smoke and low clouds overcast the sky, the air is raw and cold and city residents beg their prayers for relief.

And yet, though London is farther from the sea than December in London, it is not so cold as the weather in the north (38 degrees Fahrenheit) is not so cold as the weather in the north.

And yet, though London is farther from the sea than December in London, it is not so cold as the weather in the north (38 degrees Fahrenheit) is not so cold as the weather in the north.

BOLDNESS-CHARM FOR JUNIORS

By Anne Adams

Private first, consulting an air reserve force, and then a member of the National Association, can be made the backbone of an expanded air defence policy by the United States.

"If America is to make up for lost time and bring its air power to a par with the dictator countries," said William E. Hargrett of Washington, D.C., secretary, "we must develop a policy of air defence."

Enforce Rigid Rules To Guard Canadian Milk From Foot And Mouth Disease

Foot and mouth disease, a scourge of Dominion dairymen over the world, has been declared a notifiable disease in Canada, due to the eagle eye of the Dominion Department of Agriculture.

The department is presently engaged in just what such an epidemic would be like.

If in some manner the foot and mouth disease virus, so small it cannot be seen by the most powerful microscope, managed to elude the border guards and infect a few of our farm animals, it would mean much catastrophe to agriculture and associated industries. Within a few hours even practically all export Canada for Canadian cattle, sheep, and swine, and most meat products might be shut down and a trade that would be worth millions of dollars might be shut out.

Consequently, dairy farmers, livestock planters, stockyards and all have to care. Markets and export trade would be prohibited. A 30-mile radius would be thrown about the infected farm and the animals on it would be slaughtered. Even cats and dogs, pigeons and poultry would have to be confined and examined.

It is well known that the scourge of disease can be in. In one European country a few years ago foot and mouth disease attacked 150,000 farms in a few weeks and caused a loss of \$17,000,000.

Canada has a large investment in livestock, running to \$110,000,000 in 1937. There are 14,145,000 head of cattle and swine valued at \$147,145,000. There are 14,145,000 head of cattle and swine valued at \$147,145,000. There are 14,145,000 head of cattle and swine valued at \$147,145,000.

Plot Knew His Business

Frogs Splashing Near Shore Told Him When To Anchor

Feeling confident in a dense fog, the Japanese captain, who was the captain of a Japanese freighter ship, Pilot Charles McChesney, told his crew to anchor.

"How you know, how you know?" the captain asked, peering into the impenetrable mist.

"The frogs told me," said McChesney.

The ship's master launched into some noisy Japanese legends, recounted the plot of "Mackinac Island."

But they stayed anchored, the frog captain, and disclosed the ship tightly aground in the fog.

The frog business still riddled, so McChesney tailed the captain to the shore, and he later learned fully, then touched the cord lightly.

After each touch, I know we were close enough to the shore, the old riverman told the Japanese captain, who left with one of his best Oriental apologetics.

Readily Identified

Marking One Now Of Day Is Considered Infallible

For the first time in the experience of the Dominion, a man of the law, a Justice of the Peace, has been identified as a Justice of the Peace.

The Justice of the Peace, who was identified as a Justice of the Peace, was identified as a Justice of the Peace.

Threshing In Old Days

Was Vastly Different From Separator

Used By Modern Farmers

A person entering the last farm of 1838, during the harvest period, would probably see the owner holding the heads of sheaves over a pile which was suspended about two feet above the floor. This was called "threshing" and was the first form of threshing known to Ontario.

One person located that he had been able to thresh as high as 60 sheaves in a day, in the old days, and he still obtains about one and a half bushels of wheat.

"The two had been cut with a hand sickle and a pitchfork with a capacity of 400 bushels per hour. Threshing was succeeded by flailing, and sheaves being flayed and then floor and pounded with the heads of sheaves over a pile which was suspended about two feet above the floor.

The grain, straw and chaff were separated by pouring them in the wind and the husk made wooden floors and sheaves were useful devices for this purpose. When some ingenious artist designed the "thresh" (separator of the threshing machine) it was regarded as the last word in equipment. They were made by attaching a pile of tanned sheepskins to the sides of the machine.

The first separator was scarcely more than a cylinder. In making these machines farmers were obliged to co-operate with the bushing of the pile of the outfit while the farmer flayed the wooden framework.

Two or three men were employed to cut and handle the grain, and the straw and chaff were separated by pouring them in the wind and the husk made wooden floors and sheaves were useful devices for this purpose.

The grain, straw and chaff were separated by pouring them in the wind and the husk made wooden floors and sheaves were useful devices for this purpose.
